QUESTION NO: 1

An application must be assigned to all users in the Finance directory group. New members of the directory group must receive the application automatically, and each user must receive the application on all of their enrolled devices.

Which assignment target should the administrator create?

- A. A Smart Group with the Finance user group criterion
- B. A device tag assigned to currently enrolled Finance devices
- C. An organization group containing the Finance administrators
- D. A static list of Finance device serial numbers

ANSWER: A

Explanation:

A **Smart Group** that uses the Finance user group as a criterion dynamically targets all enrolled devices associated with users in that directory group. Membership is updated as directory group membership changes. A device tag targets individual tagged devices, while an organization group or a static device list does not provide the required user-group-based dynamic assignment.

QUESTION NO: 2

An organization publishes a SaaS application through Workspace ONE Access. Only members of the Sales directory group must see and launch the application in Intelligent Hub. Access must be removed automatically when a user leaves the directory group.

Which configuration should the administrator use?

- A. Assign the application entitlement to the Sales group in Workspace ONE Access
- B. Assign a Workspace ONE UEM device profile to a Sales Smart Group
- C. Create an Android EMM application assignment for the Sales group
- D. Add Sales users to the UEM administrator role

ANSWER: A

Explanation:

The administrator should assign the application entitlement to the **Sales group in Workspace ONE Access**. Workspace ONE Access evaluates group membership for application entitlements, allowing access to be added and removed as directory membership changes. A Workspace ONE UEM Smart Group is used for UEM resource assignments and does not control Workspace ONE Access SaaS application entitlement.
