QUESTION NO: 1

A university plans to renovate a dormitory building. The customer wants to reduce the number of access switches and intermediate equipment rooms, while providing a clearly managed network access point for each student room. Which Campus OptiX design is the best fit?

- A. Deploy 1 Terminal @ 1 Room
- B. Deploy one shared terminal for each floor
- C. Deploy additional access switches in each equipment room

ANSWER: A

Explanation:

1 Terminal @ 1 Room is correct because it provides a room-level service boundary and supports managed access for each dormitory room. The all-optical architecture also reduces the active equipment traditionally required at the access layer.

A shared terminal for an entire floor reduces room-level service granularity. Adding more access switches and equipment rooms works against the customer's requirement to simplify the access network.

QUESTION NO: 2

A sales proposal combines DC908 and Campus OptiX information. Which three values belong to the DC908 proposition? Select three.

- A. Payback within 1 year for self-built networks
- B. 30%+ higher performance than the industry average
- C. Double the industry's average stability
- D. 1 Day Service Ready
- E. 1 Terminal @ 1 Room

ANSWER: A B C

Explanation:

Payback within 1 year for self-built networks, 30%+ higher performance than the industry average, and double the industry's average stability are DC908 selling values. 1 Day Service Ready and 1 Terminal @ 1 Room are Campus OptiX messages for enterprise optical access scenarios.
